

Logbook

The app is a quiet book of what you said and what was done about it. You open it rarely, and when you do, it reads like a page, not a dashboard.

WHAT IT BETS ON

That the only question you ever bring to the screen is “did that land, and what did it do with it?” Everything that is not an answer to that question moves off the home view.

AT A GLANCE

Structure	One screen: a newest-first log, grouped by day. Live capture rises over it as a sheet. Settings behind one button.
Autonomy	Acts on its own, then shows a receipt. Every receipt has Undo and “Not a task”; every plain note has “Make this a task”.
Type	New York (Apple's serif) for everything you said; SF Pro for everything the app says. The two voices never mix.
Colour	Warm paper, dark ink, one burnt-orange accent that only ever means “the app did something”.
Sound and touch	The full sequence stays: question, wood, answer. Follows the silent switch; the tap pattern carries the same message.
Lock Screen	A Live Activity per recording that ends as a receipt for 15 minutes. Between recordings: nothing, or a small “last note” widget.

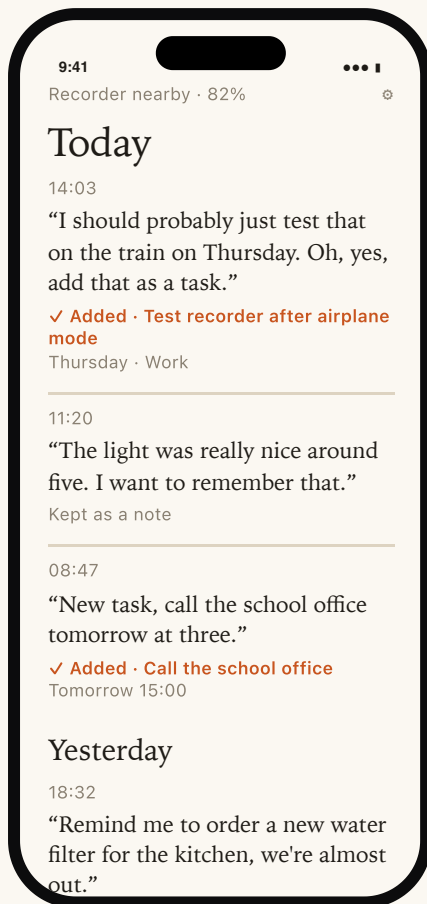

COLOUR

TYPE

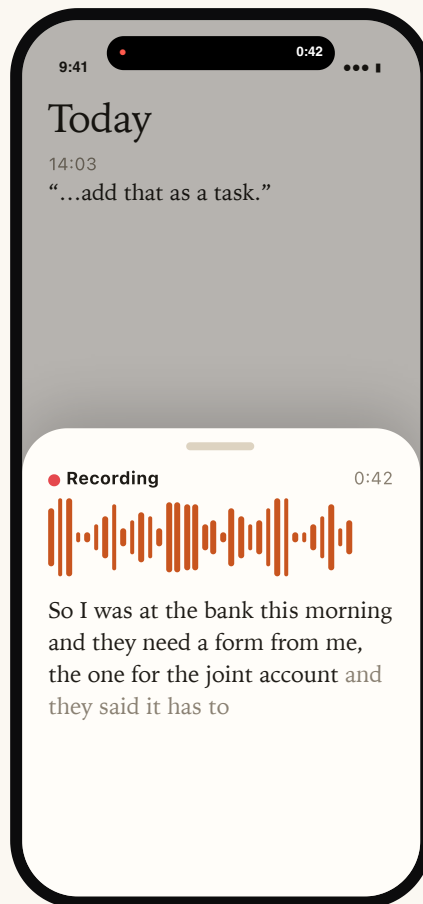

Call the dentist, tomorrow at three

The three screens you would see most

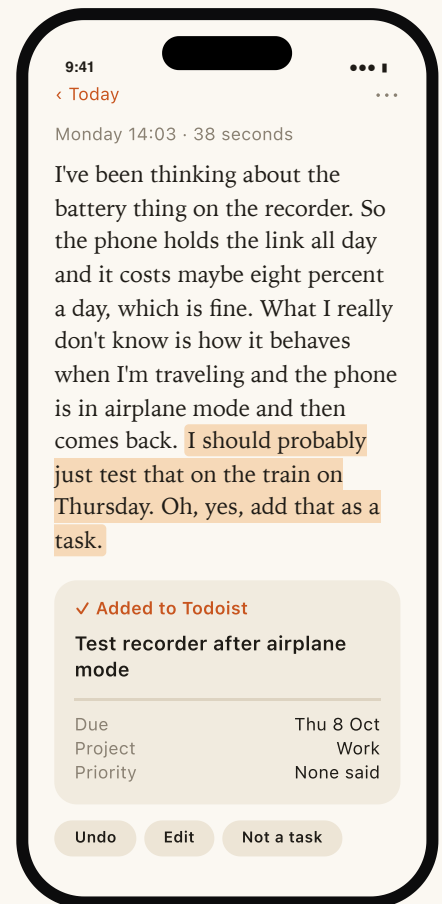

HOME: THE LOG

Each entry is your own sentence, then one line saying what the app did with it. No buttons, no waveform, no settings.

LIVE: A SHEET OVER THE LOG

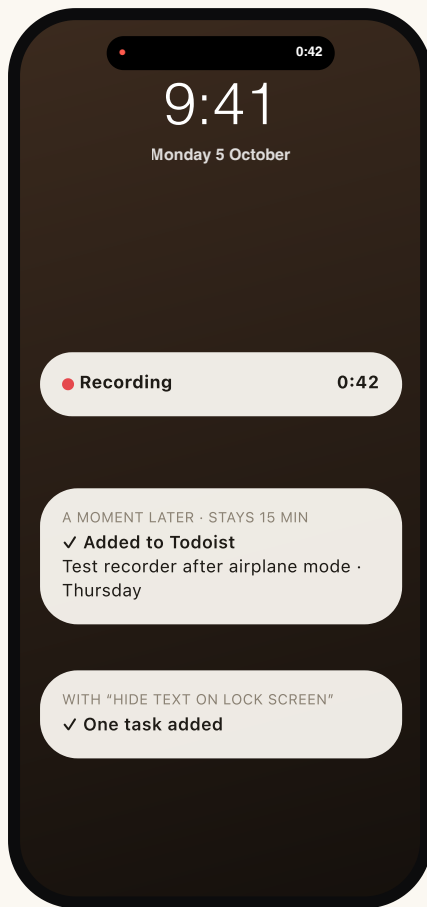

If you unlock while recording, the capture view is already up. Swipe it down and the log is underneath. It leaves when the note is done.

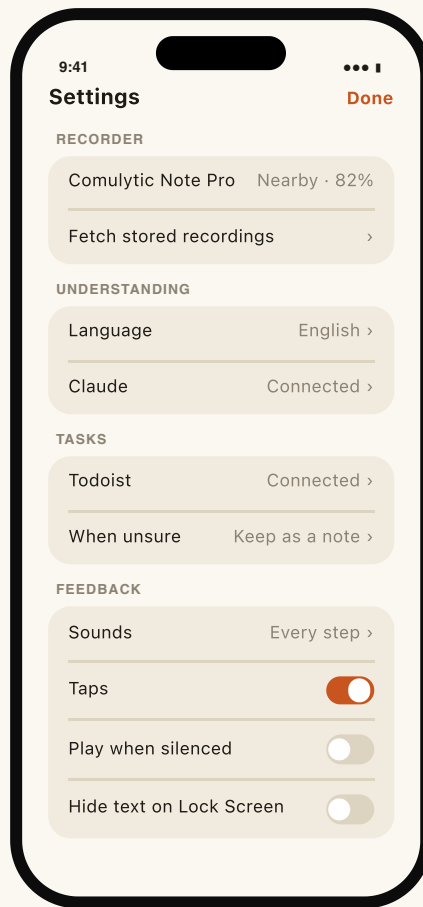

A NOTE: HEARD, DECIDED, DONE

The sentence that triggered the task is marked in the transcript, so the reason is visible. Every field can be changed; the task can be undone.

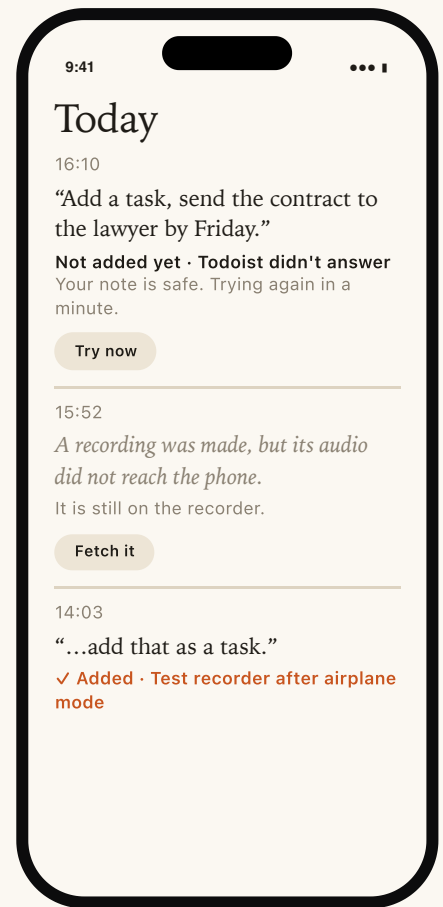

Off the screen, in settings, and when something goes wrong

**LOCK SCREEN: A RECEIPT, THEN GONE**

One fact per glance. The activity belongs to a recording, not to the connection, and its last state is the receipt.

**SETTINGS: ONE SHEET**

Four groups, opened from the gear. Keys are entered once and then just read "Connected". The recorder is found without being asked for.

**WHEN SOMETHING FAILS**

A failure is an entry in the same log, in plain words, with the one thing to do. The first sentence is always that the note is safe.

Why this direction, and what it costs

GROUNDING IN THE RESEARCH

The research's main finding is that the app should be where you check what happened, with the moment itself carried by sound, touch and the Lock Screen. This direction takes that literally: the home view is the audit log, and nothing else.

Voice Memos, Apple Notes and Things all use a single list with capture rising from the same screen. Published guidance on AI agents asks for a chronological record of actions, each with its reason and an undo. Your transcript list is already most of that.

Two typefaces separate the two voices: what you said (serif) and what the app did (sans, accent). Apple ships New York for long-form reading, so this costs nothing and keeps Dynamic Type.

TRUE OF ALL THREE DIRECTIONS

- The recorder is found automatically; keys are entered once and kept in the keychain.
- “Your note is safe” is said first in every failure, because the recorder keeps the full copy.
- The Live Activity belongs to a recording and ends as a receipt. Today's permanent “connected” banner goes away.
- Lock Screen text can be hidden.
- Every state is available by sound, by touch and by sight; each can be switched off.
- Sounds follow the silent switch unless you choose otherwise.

NOT SETTLED YET

The mock-ups are drawn by hand in HTML to show structure and character; they are not final visual design and no screenshots of other apps were consulted. One technical question affects all three: whether iOS lets the app start a Live Activity when a recording begins while the phone is locked. Apple's guidance assumes it is started from the app or by a push. This needs a small test before the Lock Screen design is relied on.

RISKS AND COSTS

- It is the least “app-like” of the three. There is no dashboard to admire, and no at-a-glance device panel.
- The live view is one step removed. That is deliberate, but if you often watch the waveform, B serves you better.
- It acts without asking. A wrong task is one tap to undo, but it will exist in Todoist for a moment.

WHAT WOULD BE BUILT FIRST

- The log with the heard / done line per note
- The note view with marked source sentence, Undo and “Not a task”
- Settings as one sheet
- Live Activity per recording, ending as a receipt
