

Inbox

The app is an inbox for what the agent did and what it was not sure about. It looks and behaves like a stock iOS 26 app, and it asks you only when it has a real question.

WHAT IT BETS ON

That as the agent learns to do more than add one task, the thing you need is a place to review its work, with the doubtful cases sorted to the top.

AT A GLANCE

Structure	Two tabs, Notes and Tasks, in the iOS 26 floating tab bar. A live strip rides above the tab bar while recording.
Autonomy	Acts when it is sure. When it is not, the note waits under “Needs a look” with a one-tap yes or no.
Type	SF Pro throughout, system text styles, Dynamic Type for free.
Colour	System greys and white. One indigo that marks anything the agent produced.
Sound and touch	The start and the answer are heard. The middle steps become taps only, to keep daily use quiet.
Lock Screen	A Live Activity per recording. It ends as a receipt, or as a question if the note needs a look.

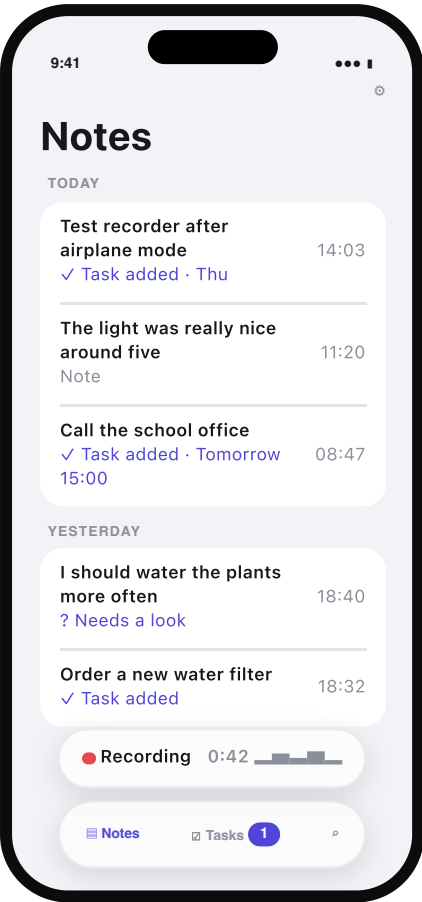

COLOUR

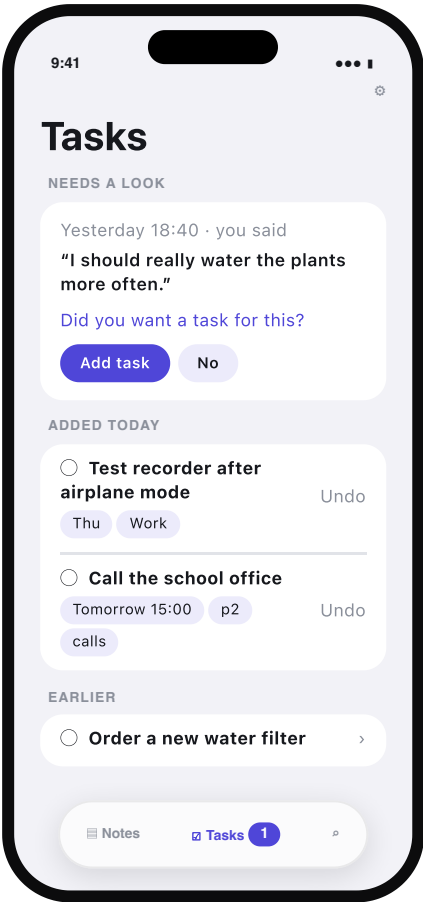

TYPE

Call the dentist, tomorrow at three

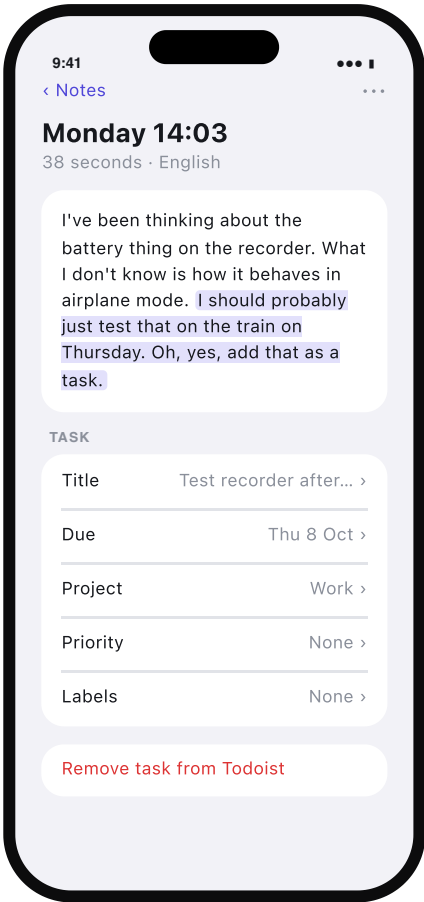

The three screens you would see most

NOTES, WITH THE LIVE STRIP
A standard grouped list. While recording, a strip sits above the tab bar the way the player does in Music; tap it for the full live view.

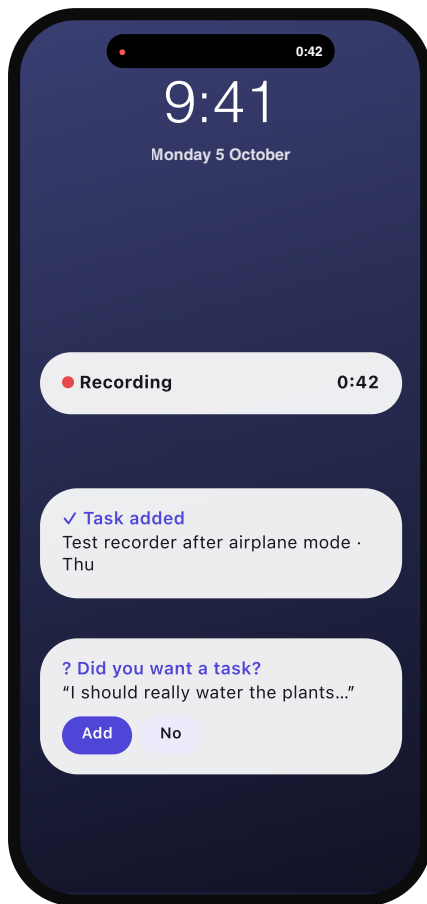

TASKS: WHAT THE AGENT DID
Doubtful notes come first, each with one question. Below, everything it added, with the fields as chips and Undo on the row.

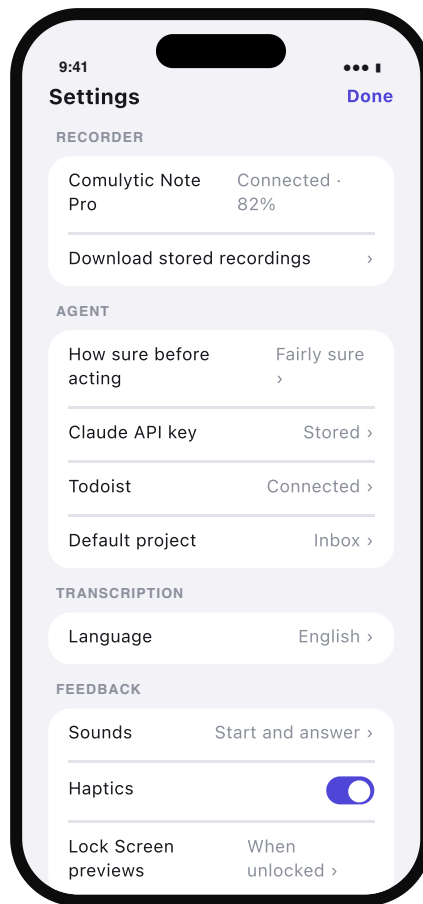

A NOTE AND ITS TASK
The transcript on top with the source sentence marked, then the task as an ordinary editable form. Changes go straight to Todoist.

Off the screen, in settings, and when something goes wrong

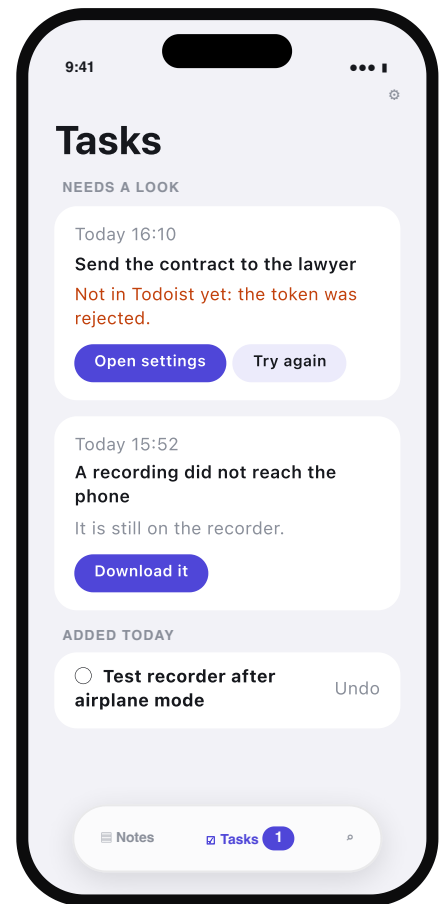

LOCK SCREEN: RECEIPT OR QUESTION

The activity ends one of two ways: a receipt, or the single question, answerable without unlocking.

SETTINGS: STOCK GROUPED LIST

The one setting that is new here is how sure the agent must be before it acts by itself.

WHEN SOMETHING FAILS

Failures join the same “Needs a look” queue as doubtful notes, so there is one place to check and one badge to clear.

Why this direction, and what it costs

GROUNDING IN THE RESEARCH

It follows the iOS 26 rules most closely: glass only on the tab bar and the live strip, content on plain opaque surfaces, one tinted action per screen. Apple documents the strip above the tab bar for exactly this kind of ongoing activity.

Todoist's own voice feature, Ramble, works from the principle "easy correction beats perfect first-time accuracy". The research adds that people want no confirmation when things went right and an explicit question once something is in doubt. The "Needs a look" queue is that idea.

It scales. When the agent can do more than one task per note, or more than tasks, each new kind of action is another row type in the same Tasks tab.

RISKS AND COSTS

- With one task per note and a reliable extractor, the Tasks tab mostly repeats the Notes tab. Two tabs may be more structure than today's feature set needs.
- A review queue is a second inbox to keep empty. If it fills with trivial questions, it becomes the thing you avoid.
- It needs a notion of "not sure" from the extractor, which does not exist yet: today it answers task or no task.
- It is the least distinctive of the three; it will look like many other iOS 26 apps.

WHAT WOULD BE BUILT FIRST

- A confidence answer from the extractor (sure / unsure), with eval cases for it
- The Notes list and note form
- The Tasks tab with "Needs a look"
- The live strip above the tab bar

TRUE OF ALL THREE DIRECTIONS

- The recorder is found automatically; keys are entered once and kept in the keychain.
- "Your note is safe" is said first in every failure, because the recorder keeps the full copy.
- The Live Activity belongs to a recording and ends as a receipt. Today's permanent "connected" banner goes away.
- Lock Screen text can be hidden.
- Every state is available by sound, by touch and by sight; each can be switched off.
- Sounds follow the silent switch unless you choose otherwise.

NOT SETTLED YET

The mock-ups are drawn by hand in HTML to show structure and character; they are not final visual design and no screenshots of other apps were consulted. One technical question affects all three: whether iOS lets the app start a Live Activity when a recording begins while the phone is locked. Apple's guidance assumes it is started from the app or by a push. This needs a small test before the Lock Screen design is relied on.
